# AXIS, ANGLE & Rotation Matrix

### **BYIII**

## 1 Composition of Rotation Matrix

**Problem:** Given rotation axis, a rotation angle, generate the corresponding rotation atrix.

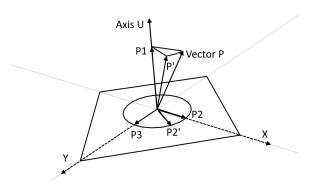

Figure 1: Rotating a vector P about the axis U

#### Solution

As show in Figure 1, the axis **U** goes through the origin, a vector **P** rotates about **U** to **P**'. Let  $\theta$  denotes the rotation angle, and let  $\phi$  denotes the angle between **U** and **P**. From **U** we can define a plane  $S(\text{whose normal is }\mathbf{U})$ . Now we have:

$$\mathbf{U} = [u_x, u_y, u_z]^T, \\ u_x^2 + u_y^2 + u_z^2 = 1, \\ \mathbf{P} = [x, y, z]^T, \\ \mathbf{P}' = [x', y', z']^T.$$

Project **P** to **U** and S, we can get  $\mathbf{P}_1$  and  $\mathbf{P}_2$ :

$$\mathbf{P} = \mathbf{P}_1 + \mathbf{P}_2,$$

$$\mathbf{P}_1 = (\mathbf{P} \cdot \mathbf{U})\mathbf{U},$$

$$|\mathbf{P}_1| = |\mathbf{P}|\cos\phi,$$

$$\mathbf{P}_2 = \mathbf{P} - \mathbf{P}_1,$$

$$|\mathbf{P}_2| = |\mathbf{P}|\sin\phi.$$

Notice that rotating  $\mathbf{P}$  is equivalent to firstly rotating  $\mathbf{P}_2$  a  $\theta$  angle to  $\mathbf{P}_2'$  and then combining  $\mathbf{P}_1$  and  $\mathbf{P}_2'$  to form  $\mathbf{P}'$ . So, next step is to determine  $\mathbf{P}_2'$ .

To represent  $\mathbf{P}_2'$ , we first to establish some frame for plane S. It is convenient to choose vector  $\mathbf{P}_2$  be the *unit vector*(though, maybe  $|\mathbf{P}_2| \neq 1$ ) of the X axis, and some other vector

 $\mathbf{P}_3$  with the same length of  $\mathbf{P}_2$  as the Y axis of plane S, which satisfies

$${\bf P}_2 \cdot {\bf P}_3 = 0,$$
  
 $|{\bf P}_2| = |{\bf P}_2'| = |{\bf P}_3|.$ 

Now, according to the rotation matrix in 2D plane, we can write:

$$\mathbf{P}_2' = \mathbf{P}_2 \cos \theta + \mathbf{P}_3 \sin \theta.$$

Then, we determine  $P_3$ . It is true that  $P_3$  is parallel to  $P \times U$ , and

$$|\mathbf{P} \times \mathbf{U}| = |\mathbf{P}| \cdot 1 \cdot \sin \phi = |\mathbf{P}_2| = |\mathbf{P}_3|.$$

So we can get:

$$\mathbf{P}_3 = \mathbf{P} \times \mathbf{U}$$
.

Combining above:

$$\mathbf{P}' = \mathbf{P}_1 + \mathbf{P}_2'$$

$$= (\mathbf{P} \cdot \mathbf{U})\mathbf{U} + [\mathbf{P} - (\mathbf{P} \cdot \mathbf{U})\mathbf{U}]\cos\theta + \mathbf{P} \times \mathbf{U}\sin\theta$$

$$= \mathbf{P}\cos\theta + (\mathbf{P} \cdot \mathbf{U})\mathbf{U}(1 - \cos\theta) + \mathbf{P} \times \mathbf{U}\sin\theta$$

Therefore, the rotatio matrix is

$$\mathbf{R} = \begin{bmatrix} u_x^2(1-\cos\theta) + \cos\theta & u_x u_y (1-\cos\theta) - u_z \sin\theta & u_x u_z (1-\cos\theta) + u_y \sin\theta \\ u_x u_y (1-\cos\theta) + u_z \sin\theta & u_y^2 (1-\cos\theta) + \cos\theta & u_y u_z (1-\cos\theta) - u_x \sin\theta \\ u_x u_z (1-\cos\theta) - u_y \sin\theta & u_y u_z (1-\cos\theta) + u_x \sin\theta & u_z^2 (1-\cos\theta) + \cos\theta \end{bmatrix}$$

Reference: Rodrigues' rotation formula

## 2 Decomposition

**Problem:** Given the rotation matrix, to extract rotation axis and the rotation angle. **Solution** 

Denotes the rotation matrix as  $\mathbf{R}$ :

$$\mathbf{R} = \begin{bmatrix} r_{11} & r_{12} & r_{13} \\ r_{21} & r_{22} & r_{23} \\ r_{31} & r_{32} & r_{33} \end{bmatrix}.$$

If from the matrix **R** we find rotation axis **U** and rotation angle  $\theta$ , then **R** can be rewrotten as:

$$\mathbf{R} = \begin{bmatrix} u_x^2(1-\cos\theta) + \cos\theta & u_x u_y(1-\cos\theta) - u_z \sin\theta & u_x u_z(1-\cos\theta) + u_y \sin\theta \\ u_x u_y(1-\cos\theta) + u_z \sin\theta & u_y^2(1-\cos\theta) + \cos\theta & u_y u_z(1-\cos\theta) - u_x \sin\theta \\ u_x u_z(1-\cos\theta) - u_y \sin\theta & u_y u_z(1-\cos\theta) + u_x \sin\theta & u_z^2(1-\cos\theta) + \cos\theta \end{bmatrix}.$$

Thinking matrix  $\mathbf{R}$  as a linear transformation, it just changes a vector's orientation and has nothing to do with the vector's length. So, 1 must be an eigen value of  $\mathbf{R}$ :

$$\mathbf{R}\mathbf{v} = 1 \cdot \mathbf{v}$$
.

And the eigen vector corresponding to eigen value 1 must be the rotation axis, because  $\mathbf{R}$  does not change its orientation. Therefore, let's consider the eigen value decomposition of matrix  $\mathbf{R}$ .

Consider a very simple case, **A** being the rotation matrix of rotating about the X axis by a  $\theta$  angle:

$$\mathbf{A} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & \cos \theta & -\sin \theta \\ 0 & \sin \theta & \cos \theta \end{bmatrix}.$$

The eigen values of  ${\bf A}$  are: 1,  $e^{i\theta},\,e^{-i\theta}.$  Then the trace of matrix  ${\bf A}$  is:

$$trA = 1 + 2\cos\theta.$$

So the rotation angle can be calculated from the trace of the rotation matrix:

$$\cos \theta = \frac{1}{2}(tr\mathbf{A} - 1).$$

For the complex formation of rotation matrix  $\mathbf{R}$ , it is the same that

$$tr\mathbf{R} = (u_x^2 + u_y^2 + u_z^2)(1 - \cos\theta) + 3\cos\theta$$
$$= 1 + 2\cos\theta.$$

Since the geometry multiplicity of eigen value 1 of rotation matrix is 1, the rotation axis can be calculated from the null space of matrix  $(\mathbf{R} - \mathbf{I})$ .
